

Inventory cost and control cheat sheet extra info:

Julia: Here are some extra facts about the notebook I'm sending you:

The presentation is divided up into four sections.

- 1) Initial problem description, and display of the results.
- 2) A walk through of how we calculate the results every day, and what happens for our inside sales team.
- 3) Analysis of the results, and verification that the system works
- 4) Conclusion describing the impact the system has had on the business.

I see this as a really great thing for the people who have recently joined the community and are at the very early stages of their data science journey, because so much of it relies on external API calls, and odd data wrangling. I have tried to be as explicit as I could with the work, but I am uncertain if it will be understood. I would really appreciate your feedback on this point.

The third section may be a little high level for the audience, but I am not certain. I would appreciate it if you would let me know your thoughts on what I have there. It is basically just a rundown on how to calculate some specific KPIs. If you think it's too nitty-gritty, I can leave it out and just paste in the final part where we have a look at the graphs.

In all the sections I plan on describing what is happening verbally while making the presentation. If you would like to see a "script" of what I intend to say, I'll have to make one up for you. Since most of this analysis happened in my head first, I don't really have a formal script written up.

As always, I am open to discussing tweaks or more serious modifications to the presentation if you have some suggestions.
